1. Use-Case Name

Study Theory

1.1 Brief Description

This use case allows the Learner to review the condensed theoretical content of a lesson before taking the associated quiz. The theory content is presented in a concise, easy-to-digest format (e.g., key points, short explanations, examples) rather than a long-form article, so the Learner can grasp the core concepts quickly. This use case is included by the **Study Lesson** use case and represents the first stage of the lesson study flow.

Advanced Grammar

Theory: Part 1 of 333%

15 min est.

Present Perfect

Defining the Present Perfect

A tense connecting the past to the present. Formed by combining:
Subject + have/has + Past Participle.

✓ Common Usage

Used to describe an action that happened at an unspecified time in the past or to talk about life experiences.

🗣 Illustrative Example

"I **have traveled** to London twice."
(Emphasizing the experience itself over the specific date it occurred)

2. Flow of Events

2.1 Basic Flow

This use case begins immediately after the system displays the lesson study screen and starts with the theory content section (triggered from the Study Lesson use case).

1. The system retrieves the condensed theory content associated with the selected lesson (key points, short explanations, illustrative examples).
2. The system displays the theory content on screen, organized into short, clearly separated sections (e.g., cards, bullet points, or paginated slides).
3. The Learner reads through the theory content, navigating between sections using "Next" / "Previous" controls if the content spans multiple sections.
4. Once the Learner has reviewed all theory sections, the system enables the "Continue to Quiz" button.
5. The Learner selects "Continue to Quiz."

2 / 7

6. The use case ends, and control returns to the Study Lesson use case, which proceeds to the Take Quiz use case.

2.2 Alternative Flows

2.2.1 Empty Theory Content

Trigger condition: The selected lesson has no theory content configured (data not yet entered).

1. At step 1 of the Basic Flow, the system detects that no theory content exists for the lesson.
2. The system displays the message "No theory content is available for this lesson yet."
3. The system automatically enables the "Continue to Quiz" button so the Learner is not blocked.
4. The use case ends.

2.2.2 Load Failure / Network Error

Trigger condition: An error occurs while retrieving theory content from the server (network error, server 500 error, timeout).

1. At step 1 of the Basic Flow, the request to fetch theory content fails.
2. The system displays a user-friendly error message, e.g., "Unable to load the lesson content. Please check your network connection and try again."
3. The system provides a "Retry" button.
4. If the Learner selects "Retry," the flow returns to step 1 of the Basic Flow.
5. If the Learner takes no action, the use case ends.

2.2.3 Learner Revisits Theory Content

Reviewing: Cognitive Load Theory in Interface Design

🕒 12 min read

📅 Completed Oct 24, 2024

I. The Fundamentals of Cognitive Load

Cognitive load theory was established by John Sweller in 1988. It suggests that since short-term memory has a limited capacity, instructional methods should avoid overloading it with additional activities that don't directly contribute to learning.

"Learning is the permanent change in long-term memory. If nothing has changed in long-term memory, nothing has been learned."

II. Three Types of Cognitive Load

Intrinsic

The inherent difficulty associated with a specific instructional topic.

Extraneous

The way information or tasks are presented to a learner.

Germane

The work put into creating a permanent store of knowledge.

III. Implications for UX Design

In modern interface design, minimizing extraneous load is paramount. This is achieved through consistent patterns, clear visual hierarchy, and the removal of "visual noise" that distracts the user from their primary objective.

Feeling confident? Test your knowledge again.

Trigger condition: The Learner has already completed the quiz for this lesson previously and re-opens the lesson to review the theory content again.

1. At step 2 of the Basic Flow, the system detects that the Learner has already completed this lesson.
2. The system displays the theory content in a read-only review mode, along with a note indicating the lesson has already been completed.
3. The Learner may still navigate through the content and choose "Continue to Quiz" to retake the quiz, or exit back to the lesson list.
4. The use case ends.

3. Special Requirements

3.1 Performance

Theory content must be fully loaded and rendered within a maximum of 2 seconds under normal network conditions.

3.2 Usability

Theory content must remain concise (condensed format), avoiding long blocks of text. Each section should be scannable within a few seconds, using visual aids (icons, highlighted keywords, short examples) to support quick comprehension.

4. Preconditions

4.1 Lesson Loaded

The lesson study screen has already been loaded and the Study Lesson use case has directed the flow to the theory content section.

5. Postconditions

5.1 Theory Section Marked as Reviewed

The system has recorded that the Learner has reviewed the theory content for this lesson, and the Learner has been directed to proceed to the quiz section.

6. Extension Points

6.1 Proceed to Quiz

This extension point occurs at step 5 of the Basic Flow, after the Learner selects "Continue to Quiz." This is the point where control returns to the Study Lesson use case, which then includes the **Take Quiz** use case.
